

Outsmart the Cycle of Chronic Lung Infection:

Smart Results with SmartVest

The SmartVest® Airway Clearance System was associated with a significant reduction in bronchiectasis-related healthcare utilization.

High frequency chest wall oscillation (HFCWO) is an airway clearance treatment used to loosen, thin, and mobilize airway secretions for a number of chronic airway compromising diseases and conditions including non-cystic fibrosis bronchiectasis.

In a recently published case review outcome-based study, the clinical effectiveness of SmartVest was proven by comparing a year of exacerbation-related healthcare utilization for 59 non-cystic fibrosis bronchiectasis patients to a standard of care control.¹

By consistently using SmartVest, the study population experienced reduced antibiotic prescriptions, hospitalizations, and emergency department visits.

This outcome-based study demonstrated a significant reduction in healthcare utilization when bronchiectasis patients were treated with SmartVest for one year. And although it was not a part of the protocol, 68% of the patient population unreservedly reported a significant improvement in their quality of life after a year of using SmartVest, representing a potentially appreciable impact on overall patient well-being.

Key Study Findings

57%

reduction in antibiotic prescriptions

59%

decrease in hospitalizations

60%

fewer emergency department visits

68%

unreservedly reported improvement in quality of life
